

Instruction Sheet

Low Level Switch Assembly Model No. 29190

Model 29190 Low Level Switch Assembly is an integral low level shut off switch for use with LMI Series A7, A9, B7, B9, C7, C9 and P7 metering pumps.

When your solution reaches a low level, the switch provides protection to your pump by shutting the pump off, reducing wear caused by dry pumping action and loss of prime.

Durable, corrosion resistant PVC and polypropylene construction make this accessory compatible with a wide variety of solutions.

INSTALLATION

1. Lead the low level switch cable through the ceramic weight and plug the cable into the low level jack on the control panel side of the pump.
2. Mount so that the low level switch is hanging straight, a minimum of 2 inches above the bottom of the tank.

NOTE:

Some slack in the low level switch cable between the pump and the point of entry into the tank is necessary to insure the cable does not pull out of the pump.

To provide sufficient slack and proper position of the switch from the tank bottom, knot the cable on the top of the tank.

SWITCH LOGIC

The raising or lowering of the low level switch opens and closes a switch. In some cases, closing of this switch will disable pump operation. If pump operation is disabled, the switch logic can be reversed as follows:

1. Remove plastic retainer.
2. Flip float over.
3. Reinstall plastic retainer.
